

STANDS REQUISITION SYSTEM

Interactive User Manual & Financial Workflow Guide

SYSTEM ARCHITECTURE & MANUAL

This manual describes the user flows, role architectures, security credentials, and requisition life cycles of the St. Andrews Church Ministry Group Requisition System. Use this document to understand the validation, approval chains, and final mobile/banking disbursement protocols.

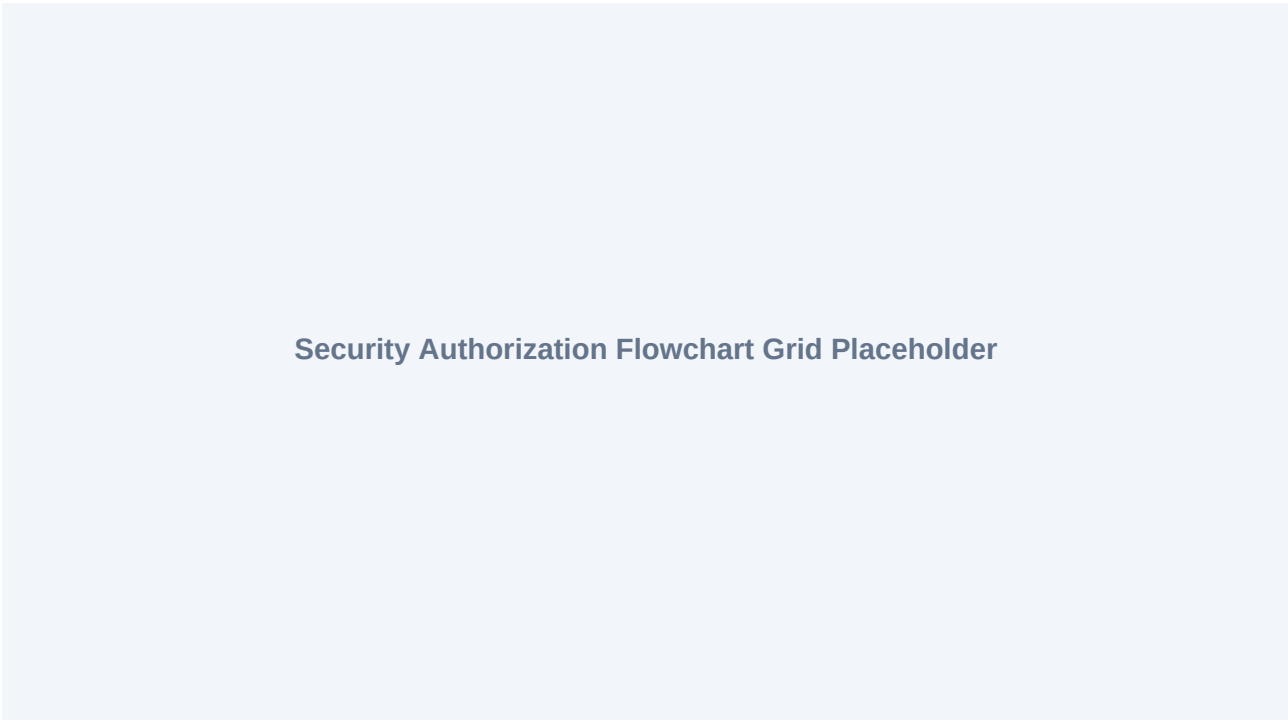

DOCUMENT VERIFICATION SCOPE:

- ½ Onboarding & Identity Approval (Waiting Room status)
- ½ Requisition submission (Sourcing vendors, budget allocations and files)
- ½ Multi-Level Verification Lifecycle (L1 Verifier & L2 Keymaster sign-off)
- ½ Treasury Release Ledger Ops (Automated payouts and checking account reconciliation)
- ½ Administration Panel Oversight (User permission controls, audit tables)

1. Identity Access Control & Onboarding

The STANDS Requisition portal adopts a zero-trust architecture. When a new system member registers, they are restricted to a secured 'Waiting Room' state. A Super Administrator or Finance Controller must verify the request, assign the appropriate Ministry Group (such as Youth, Choir, Outreach), and authorize Ledger Access before the user can participate in transactions.

SECURITY REGISTRATION WORKFLOW FLOWCHART:

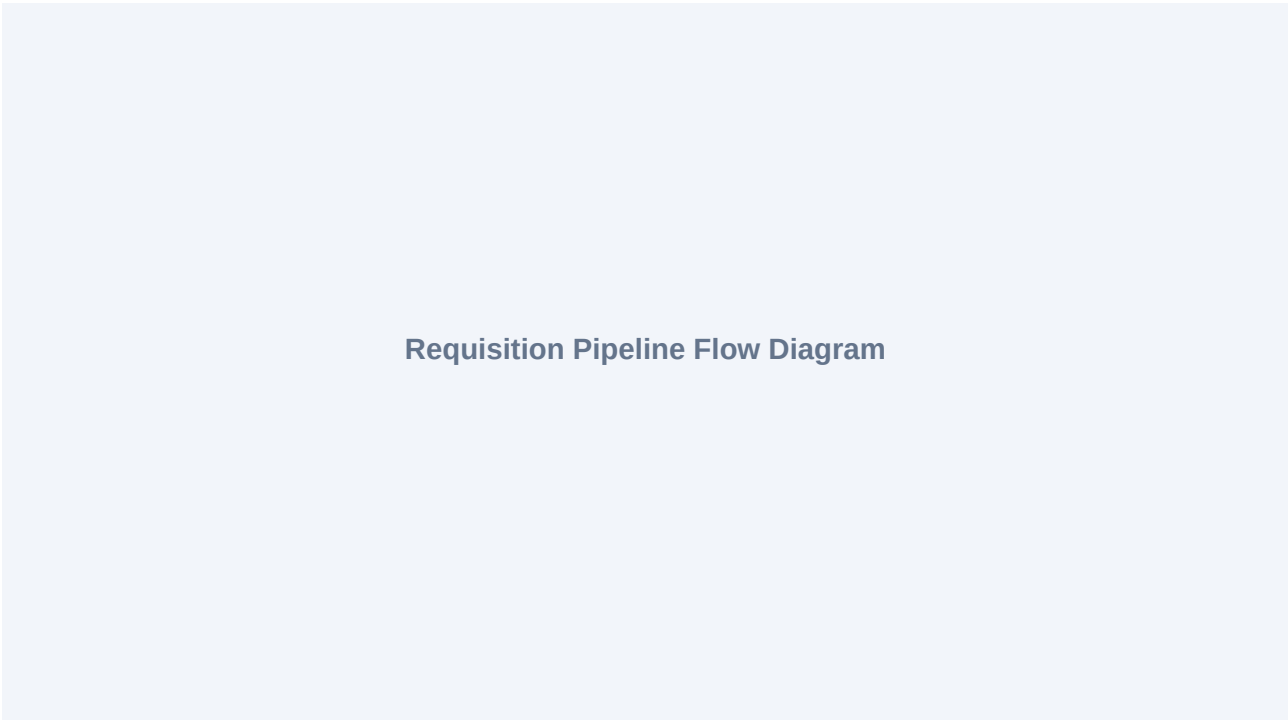

STEP-BY-STEP USER ENTRANCE:

- A. Member Sign Up**User submits credentials, choosing their main email and setting up the password profile.
- B. Waiting Room Redirect**System checks credentials in high-security rules; holds the user in state 'Synchronization Pending' page.
- C. Admin Verification**The Sudo Admin receives an event notification, verifies the registrant's affiliation, selects their active Ministry Group line, and toggles Access Status to 'Approved'.
- D. Main System Access**Once synchronized, the user is automatically redirected to the system's live home dashboard, populated with their group's budgets and ledger summaries.

2. Requisition Submission & Approval Pipeline

Ledger accounts on STANDS are linked directly to approved ministry projects and budget codes. Submitting a requisition launches a highly trackable status chain. Requisitions require digital vendor validation and multi-signature checkpoints (L1 & L2 validation) before arriving in the disbursement ledger.

APPROVAL PIPELINE STAGES & DIGITAL CODES:

UNDERSTANDING STATUS BAR CHECKPOINTS:

- SUBMITTED:** Initial draft submitted by Ministry Rep. Notified instantly on the global ledger. Triggers an email alert to the L1 Verification Board.
- APPROVED_L1:** Requisition vetted by L1 Verifiers for compliance, receipts, and vendor validity. Approved for general project scope.
- APPROVED_L2:** Treasury sign-off by L2 Keymasters. Authorizes the transaction against corresponding checking accounts.
- DISBURSED:** Final ledger payout completed. Records physical banking checks, receipt tokens, and ledger event archives.

3. Control Dashboard & System Administration

The central administrator dashboard allows real-time insights of active exposure, requisition volume, and upcoming payouts. System roles are granular, authorizing operations from budget adjustments to manual audit logs. The dashboard aggregates project breakdowns to ensure full visibility.

DASHBOARD LIVE TRACKING INTEGRATION OVERVIEW:

GRANULAR USER ROLE ASSIGNMENTS:

The system implements four tiers of authentication:

- 1. MINISTRY_REP: Can submit new requisitions and edit their group's entries while in draft stage.
- 2. APPROVER_L1: General committee verifiers. Inspects quotes, compares bids, and pushes to Level 2.
- 3. APPROVER_L2: Senior treasury officers. Checks funding pools, marks final authorization status.
- 4. SUPER_ADMIN: Global system configurations, adding new groups, manual ledger adjustments, and member status edits.
